Rear panel connections

The illustration below shows a typical example of connections for the minilogue xd. Connect the minilogue xd as appropriate for your own sound system.

1. DC 9V jack (p.8)

Connect the DC plug of the included AC adapter to this jack.

2. **xd** Cable hook (p.8)

Loop the DC plug end of the AC adapter cable around this hook to prevent the cable from being accidentally pulled out.

3. Power switch (p.8)

Use this switch to turn the minilogue xd on or off.

4. USB B port (p.57)

This port allows the minilogue xd to exchange MIDI messages with your computer.

5. MIDI IN, OUT connectors (p.56)

Connect these to an external MIDI device so that MIDI data can be transmitted and received.

6. SYNC IN, OUT jacks (p.55)

Connect these jacks to the SYNC IN, OUT jacks on the Korg volca series, to synchronize with the pulses and steps that are outputted. The SYNC OUT jack outputs a 5 V pulse, 15 ms long at the beginning of each step. Use a stereo mini cable for this connection.

7. CV IN 1, 2 jacks (p.56)

Connect these jacks to a device that can output CV signals to control the parameters of the minilogue xd. The voltage range is from -5 V to +5 V. Use a monaural mini cable (or a stereo mini cable).

8. DAMPER jack

Connect a Korg DS-1H damper pedal (sold separately) or a PS-1/PS-3 pedal switch (sold separately) to control the damper function.

⚠ The minilogue xd does not feature a half-damper function.

9. OUTPUT L/MONO, R jacks (p.8)

Connect these jacks to a powered monitor speaker or similar device. Adjust the volume level using the MASTER knob. To output monaural sound, use the OUTPUT L/MONO jack.

10. Headphones jack (p.8)

Connect your headphones to this jack. This jack outputs the same signal as that of the OUTPUT jack.

Connecting the AC adapter

1. **Connect the DC plug of the included AC adapter to the DC 9V jack located on the rear panel of the minilogue xd.**
 - ⚠ Be sure to use only the included AC adapter. Using any other AC adapter may cause malfunctions.
 -  **Hook the AC adapter cord onto the cord hook.**
 - ⚠ Do not use excessive force when pulling the cord off the hook. Doing so may damage the plug.
2. **Connect the plug of the AC adapter to an AC outlet.**
 - ⚠ Be sure to use an AC outlet of the correct voltage for your AC adapter.

Connecting audio devices

- ⚠ Be sure that all of your devices are turned off when making connections. Making connections with the power still turned on may damage the device or speaker.
- **Connect the OUTPUT L/MONO, R jacks on the minilogue xd to your powered monitor speaker, mixer or other audio device.**
 - To output monaural sound, use the OUTPUT L/MONO jack.
- **To use headphones, connect the plug on your headphones to the headphones jack.**
 - Tip:** Adjust the volume levels for the OUTPUT jacks and headphones jack using the MASTER knob.

Connecting the minilogue xd to a computer or other MIDI devices

You can connect the minilogue xd to a computer or other MIDI device via USB or MIDI to send and receive note data. Refer to “Using with other devices” (p.55) for details.

You can also poly-chain this instrument to another minilogue xd. Refer to “Poly Chain” (p.46) and “Poly-chain” (p.51) for details.

Turning the power on/off

Turning the minilogue xd on

Make sure that both the minilogue xd and any external output devices such as powered monitor speakers are turned off, and turn the volume of all devices all the way down.

1. **Hold down the Power switch on the rear panel of the minilogue xd; once the “minilogue xd” logo appears in the display, take your finger off the Power switch.**
 - The word “Tuning...” will appear on the display, and the instrument will enter Tuning mode for the analog synthesizer circuit, for around 15 seconds. After this, the minilogue xd will enter to Play mode.
2. **Turn on any external output devices such as powered monitor speakers.**
3. **Adjust the volume of your external output equipment, and adjust the minilogue xd’s volume using the MASTER knob.**

Turning the minilogue xd off

Any program data in the minilogue xd that has not been saved will be lost when the power is turned off. Be sure to save any programs and other important data that you have edited (p.16 “Saving a program”).

1. Lower the volume of your powered monitors or external output system, and turn them off.
2. Hold down the Power switch on the rear panel of the minilogue xd; to turn off the power after the display goes blank, take your finger off the power switch.
 After turning the minilogue xd off, wait about 10 seconds before turning it on again.

Auto power off feature

The minilogue xd features an auto power off feature that can automatically turn the minilogue xd off after 4 hours have elapsed with no operation of the knobs, switches, buttons, or keyboard. By default, the factory setting for **auto power off** is **enabled**. The auto power off can be disabled using the steps below.

1. Press the **EDIT MODE** button.

The minilogue xd will enter Edit mode, and the display will look like the illustration shown below.

2. Turn the **PROGRAM/VALUE** knob, and select “**GLOBAL EDIT**.”

The minilogue xd will enter **GLOBAL** Edit mode.

Tip: **GLOBAL EDIT** can also be selected by pressing the **EDIT MODE** button.

3. Press **button 8** three times.

“Auto Power Off” will be displayed.

4. Turn the **PROGRAM/VALUE** knob, and select “**Off**”.

5. Press the **EXIT** button.

The minilogue xd will enter Play mode, and the display will indicate the current program.

Playing the minilogue xd

Selecting and playing a program

The minilogue xd features 500 program memories. When the unit is shipped from the factory, preset programs are assigned to program numbers 1–200. Programs 201–500 contain init programs (programs that have been initialized).

1. Check that the minilogue xd is in Play mode.

In Play mode, verify that the EDIT MODE button on the front panel is unlit. If the EDIT MODE button is lit, press the EXIT button.

2. Turn the PROGRAM/VALUE knob to select a program.

The display will indicate the program name. For details, refer to “Program list” (p.61).

Tip: In addition to showing the program name, the display can also be used as an **oscilloscope** to show the waveform created by the electrical signals of the sound.

3. Play the keyboard and try using the joystick and OCTAVE switch and other controls on the front panel.

You can use the **OCTAVE switch** to transpose the playing area of the keyboard by ± 2 octaves.

The **joystick** mainly controls the pitch when moved from left to right, and changes parameters such as the cutoff frequency and vibrato depth when moved up and down. You can also change which parameters are controlled by the joystick. See “Button 4 (JOYSTICK)” (p.35) for details.

Use the **VOICE MODE TYPE switch** to switch between voice modes. Select a voice mode and play. To learn more about voice modes, see “VOICE MODE section” (p.17).

xd-m Playing in Keyboard mode

You can use the keyboard of an external device that is connected to the minilogue xd module via the MIDI IN connector or USB B port, or you can turn the Keyboard mode of the minilogue xd module on to play using buttons 1–16. Buttons 1–16 can be used for both step and real-time recording.

1. Flip the KEYBOARD switch up to turn Keyboard mode on.

A keyboard icon “” will be shown in the upper-right part of the display.

2. Play using buttons 1–16.

Buttons 1–16 will light to indicate the black and white keys.

3. After you’ve finished playing the buttons, flip the KEYBOARD switch down to turn Keyboard mode off.

Buttons 1–16

When the keyboard mode is set to OFF on the minilogue xd module, buttons 1–16 will operate as follows.

- Favorite programs: Recall, register
- Edit Mode: Select Edit page
- When the sequencer is playing: Step display
- Step recording: Change the step gate time, select step
- Step edit: Enable/disable step, input notes and motion sequences

Note: These operations are unavailable when the keyboard mode is ON. Use the KEYBOARD switch to switch between keyboard modes as necessary.

Using Favorites

You can use the **favorites** to register up to 16 programs that you like, to easily call them back later. Using the “Shift Function” in GLOBAL EDIT mode, begin by selecting “Favorite” (the “Favorite” is already configured by factory default). Refer to “Shift Function” (p.47) for details.

Recalling your favorite programs

1. In Play mode, press one of the buttons from 1–16 while holding down the SHIFT button. The favorite program previously registered to that button will be recalled, and the program name will be shown in the display.

Registering your favorite programs

1. In Play mode, turn the PROGRAM/VALUE knob to select the program you like. The display will indicate the program name.

2. Hold down one of the buttons from 1–16 while keeping the SHIFT button pressed. The program will be registered as a favorite program, and “Registered to Favorite” will be shown in the display.

Tip: The favorite programs that you register will be saved in the global settings.

Playing the sequencer

Each program in the minilogue xd includes sequence data. In this section, we'll play the sequence data saved as part of the preset programs.

1. Turn the **PROGRAM/VALUE** knob to select a program.

The display will indicate the program name.

2. Press the **PLAY** button in the **SEQUENCER** section.

The sequence data that is recorded in the current program will begin playing.

The 1–16 buttons will light up to show the current step while the sequencer is playing.

Tip: The sequencer tempo is set individually in each program. You can change the tempo in SEQ EDIT mode, “BPM” (p.40). You can also adjust the tempo from 56.0 to 240.0 BPM (beats per minute) by turning the **TEMPO knob**.

3. Press the **PLAY** button once more to end the Sequencer playback.

Creating sounds

You can edit the parameters that make up a program, in order to modify the sound as you like. There are two ways to create sounds on the minilogue xd.

- You can select an existing program that's close to the sound you want, and edit that program's parameters to achieve your own custom sound.
- You can also create your own sound from scratch from an init program.

Editing an existing program

1. In Program mode, select the program that you want to use as a starting point.

2. Use the knobs and switches on the front panel.

Take a moment to consider the differences between the current program and the sound you have in mind, and use the front panel controls to edit the necessary parameters.

Tip: For details on how the pitch, sound, and volume change when using the knobs and switches, refer to "Basic parameters" (p.17).

 We recommend that you save the program on the minilogue xd after editing the sound. Any edits that you make will be lost if you turn off the power or recall a different program. See "Saving a program" (p.16) for details.

Creating a program from scratch

To create a program from scratch, we recommend that you use the **panel load** function. This will load the current settings of each front panel control and provide a simple starting point for your sonic creations.

As you explore the front panel controls, you can see how each parameter will affect the sound, making it easier to understand how each section of the minilogue xd functions and how the parameters interact.

You can also create programs after initializing them (p.40 "Initialize Program").

Panel load function

When the WRITE button is pressed while holding down the SHIFT button, the panel load function will be enabled. The sound will change to reflect the panel settings, and "Load Panel" will be indicated in the display.

Saving a program

We recommend that you save your program on the minilogue xd after editing the sound to your liking.

- ⚠ Any edits that you make will be lost if you turn off the power or recall a different program before saving the program.

1. Edit the program in Play mode.

See “Basic parameters” (p.17) for details.

2. Press the WRITE button. The minilogue xd will enter write standby mode, and the WRITE button will blink.

The display will indicate the message “Where to write?”.

3. Turn the PROGRAM/VALUE knob to select the program number where your new sound will be saved.

Tip: Press the EXIT button to cancel the operation.

4. Press the WRITE button once more.

The display will indicate the message “Complete”.

- ⚠ Never turn off the power while programs are being saved. Doing so may destroy the internal data.

Basic parameters

In this section, we'll explain the basic parameters that make up a program.
The basic parameters are assigned to the knobs and switches on the front panel.

MASTER controls

To learn more about the OCTAVE button, see "Selecting and playing a program" (p.10).

TEMPO knob [BPM 56.0...240.0]

Use this parameter to adjust the tempo of the sequencer for each program in beats per minute (BPM). When the voice mode is "ARP", the value set here is also used for the arpeggiator tempo.

PORTAMENTO knob [0...127]

This parameter controls the portamento time.

The further the knob is turned to the right, the longer the portamento time will be.

VOICE MODE section

The minilogue xd features four analog synthesizer voices. By changing the Voice mode, you can combine and allocate the voices in different ways.

There are four voice modes. Use the VOICE MODE TYPE switch to select a voice mode.

Turning the VOICE MODE DEPTH knob adds different effects for each Voice mode.

Voice mode list

Type	Action	VOICE MODE DEPTH knob effect
POLY	Used for basic playing as a 4-voice polyphonic synth.	[POLY, DUO 0...1023] Turn the knob to the right to switch to DUO mode, which stacks two voices when playing a key. Turning the knob to the right will increase the sound of the stacked voice, and deepen the detune effect.
UNISON	The 4 voices will be stacked together into a single voice in unison, as a mono synth.	[Detune 0C...50C] Turning the knob to the right will increase the detuning effect.
CHORD	The voices will play as a chord.	[Mono, 5th, sus2, m, Maj, sus4, m7, 7, 7sus4, Maj7, aug, dim, m7b5, mMaj7, Maj7b5] Selects either mono or the chord type.

Type	Action	VOICE MODE DEPTH knob effect
ARP/LATCH	Uses the arpeggiator to play up to 4 voices. Switches between LATCH ON and OFF. Set the arpeggiator tempo, swing and gate time using the “TEMPO knob” (p.17), “Swing” (p.41) and “Default Gate Time” (p.41) settings.	[MANUAL 1, MANUAL 2, RISE 1, RISE 2, FALL 1, FALL 2, RISE FALL 1, RISE FALL 2, POLY 1, POLY 2, RANDOM 1, RANDOM 2, RANDOM 3] Selects the arpeggiator type. If you set the VOICE MODE TYPE switch to ARP/LATCH and then move the switch down, the latch will be turned on (the LED will blink), and the arpeggiator will keep playing even after you take your hands off the keyboard. If you move the switch up while latched, the switch will latch off (the LED will light).

VCO 1/VCO 2/MULTI ENGINE section

VCO 1, VCO 2 VCO: Voltage Controlled Oscillator

There are two oscillators in the minilogue xd. Here, we will adjust the basic settings for the sound, including pitch (OCTAVE, PITCH), waveform (WAVE, SHAPE) and so on.

WAVE switch [\[SQR □, TRI ▲, SAW ▼\]](#)

This sets the waveforms for oscillators 1 and 2.

SQR (square wave): This waveform is used for electronic and wind instrument sounds.

TRI (triangle wave): This waveform has a rounder feel than the sawtooth or square wave.

SAW (sawtooth wave): This waveform is used to create sounds typical of analog synthesizers, such as synth basses and synth brass.

OCTAVE switch [\[16', 8', 4', 2'\]](#)

The pitch of oscillators 1 and 2 can be set in octave steps.

PITCH knob [\[-1200...+1200\]](#)

The pitch, or tuning, of oscillators 1 and 2 can be set in one-cent steps.

SHAPE knob [\[0...1023\]](#)

This knob will determine the final shape, complexity, or duty-cycle (square) of the selected waveform for oscillators 1 and 2.

0 —————> 1023

SYNC switch [OFF/ON]

This switch lets you sync the oscillators.

Oscillator sync is a popular effect for creating edgy synth leads.

ON (up position): With this type of modulation, the phase of oscillator 2 is forcibly synchronized to the phase of oscillator 1. This adds harmonic overtones to the frequency of oscillator 2, making a complex waveform.

RING switch [OFF/ON]

This lets you achieve a ring modulation effect.

Adjust the pitch of oscillator 2 to create non-tonal and metallic sounds.

ON (up position): Oscillator 1 is used to ring modulate oscillator 2.

CROSS MOD DEPTH knob [0...1023]

Cross Mod (Modulation) allows oscillator 1 to modulate the pitch of oscillator 2.

Turning the knob to the right results in stronger modulation.

MULTI ENGINE

The MULTI ENGINE is a digital sound generation engine.

This engine operates as a noise generator, a VPM oscillator or a user oscillator, to make a wide range of sounds not possible with analog oscillators. You can load your own oscillator programs into the user oscillator to make sounds.

NOISE/VPM/USR switch [NOISE, VPM, USR]

This sets which engine will be used, the noise generator, VPM oscillator or user oscillator.

NOISE: The MULTI ENGINE is used as a noise generator.

VPM: The MULTI ENGINE is used as a VPM oscillator.

USR: The MULTI ENGINE is used as a user oscillator.

The TYPE knob and SHAPE knob work differently, depending on the NOISE/VPM/USER switch setting. The settings are explained below.

NOISE

Noise is used to create percussion instrument sounds, or sound effects such as surf.

Select one of the four noise generators using the TYPE knob.

Move the SHAPE knob to make changes in the sound.

TYPE knob [High/Low/Peak/Decim]

Select the noise generator to use.

The noise generator name will be indicated on the MULTI ENGINE display.

High: A high-pass filter will be used.

Low: A low-pass filter will be used.

Peak: A peak filter (bandpass filter) will be used.

Decim: A decimator will be used.

SHAPE knob

Set the noise generator parameter to make changes to the sound.

The parameters differ depending on the noise generator that you select using the TYPE knob, with the following effects.

SHAPE knob effects

Type	Parameter	Effect
High	CUTOFF (SHAPE knob)	[10.0Hz...21.0kHz] Adjusts the cutoff frequency of the HPF.
Low	CUTOFF (SHAPE knob)	[10.0Hz...21.0kHz] Adjusts the cutoff frequency of the LPF.
Peak	BANDWIDTH (SHAPE knob)	[110.0Hz...880.0Hz] Adjusts the peak characteristic bandwidth.
Decim	RATE (SHAPE knob)	[240Hz...48.0kHz] Adjusts the sample rate.
	KEY TRACK (SHIFT button+SHAPE knob)	[0.0%...100.0%] Adjusts the depth of the sample rate via keyboard tracking.

VPM

This engine is a VPM (Variable Phase Modulation) oscillator. The engine features a simple structure with one carrier and one modulator, but allows you to create a wide range of sounds. Sixteen oscillator types are available for this VPM oscillator.

TYPE knob

[Sin1...Throat]

This selects the oscillator type to use.

The name of the oscillator type will be indicated on the MULTI ENGINE display.

Tip: For the last four types after Decay1, setting Shape Mod Int to “-100%” will disable completely the effect of the EG.

Sin1: A basic oscillator type, using a sine wave for both the carrier and modulator.

Sin2: Sine wave carrier and a modulator with self-feedback.

Sin3: Sine wave carrier with a 3x harmonics modulator.

Sin4: Sine wave carrier with 5x harmonics modulator.

Saw1: Modulated sawtooth carrier basic type.

Saw2: Carrier using a sine wave to simulate a sawtooth.

Squ1: Square wave carrier type.

Squ2: Carrier using a sine wave to simulate a square wave.

Fat1: 1/4 subharmonic modulator with self-feedback and driven carrier output, emphasizing the lower harmonics.

Fat2: 3/4 subharmonic modulator with self-feedback and driven carrier output, emphasizing the lower harmonics.

Air1: Noise-modulated sine wave carrier.

Air2: Sine wave carrier modulated by both noise and a sine wave.

Decay1: Type with decaying modulation amount.

Tip: You can edit the relative offsets of the internal EG decay time of the VPM (see block diagram) by using the parameters in PROGRAM EDIT mode “Button 10 (MULTI ENGINE)” (p.39).

Decay2: Type with strong decaying modulation amount.

Creep, Throat: Experimental, somewhat atonal type with complex and evolving modulations.

SHAPE knob

Turning the SHAPE knob only will set the “MOD DEPTH,” and turning the SHAPE knob while holding down the SHIFT button will set the “RATIO OFFSET.”

These parameters are common for all oscillator types, and produce the following effects.

SHAPE knob effects

Type	Parameter	Effect
Common	MOD DEPTH (SHAPE knob)	[0.00:15.00...] (range changes depending on TYPE) This adjust the index and sets the intensity of the modulator.
	RATIO OFFSET (SHIFT button+SHAPE knob)	[1:4, 1:2, 1:1, 2:1...] (range changes depending on TYPE) This adjusts the modulator ratio and adds over-tones.

Tip: Besides the SHAPE knob, the oscillator settings can be changed in detail with six parameters in PROGRAM EDIT mode. See “When the VPM oscillator is selected” (p.39) for details.

USR

You can load your own oscillator programs into a user oscillator to make sounds on the minilogue xd.

Up to 16 user oscillators can be saved. One factory-set default user oscillator is included with the minilogue xd for demo purposes.

See the “logue SDK” (www.korg.com) for details.

TYPE knob

Selects a user oscillator.

The name of the user oscillator will be indicated on the MULTI ENGINE display.

SHAPE knob [0.0%... 100.0%]

Produces the effect that is set for the user oscillator.

MIXER section

Use this section to set the output levels of oscillator 1, 2 and the MULTI ENGINE, and to adjust the balance.

VCO 1 knob [0...1023]

VCO 2 knob [0...1023]

MULTI knob [0...1023]

These knobs control the output levels.

FILTER section

VCF

VCF: Voltage Controlled Filter

The low-pass filter creates a brighter or darker sound by selectively filtering certain parts of the harmonic spectrum of the sound generated by the oscillators and the noise generator.

CUTOFF knob [0...1023]

This knob is used to set the cutoff frequency (the frequency at which the filter is applied).

Turning the knob to the left will lower the cutoff frequency, and turning the knob to the right will raise the cutoff frequency.

- ⚠ If the CUTOFF value is set too low, the volume may be extremely low.

RESONANCE knob [0...1023]

Also known as Peak or Q, the RESONANCE control adds additional emphasis to the overtones occurring at the CUTOFF frequency, giving a distinctive character to the sound.

Turning the knob to the right will emphasize the harmonic content, increasing the resonance effect.

- Tip:** The overtones that are emphasized will change depending on the cutoff frequency. For this reason, it's good to adjust the CUTOFF knob while adjusting the RESONANCE knob.
- ⚠ When emphasizing the overtones in this way, the sound may distort depending on the cutoff frequency or the input audio.

DRIVE switch [0%, 50%, 100%]

Sets the distortion effect produced by the drive circuit, in three stages.

0% (switch in the lower position): no drive effect.

50% (switch in the center position): drive effect will be set at half strength.

100% (switch in the upper position): drive effect will be set at maximum.

KEYTRACK switch [0%, 50%, 100%]

Key tracking allows the note played on the keyboard to influence the cutoff frequency of the filter.

0% (lower position): No keyboard tracking will be applied.

50% (center position): Keyboard tracking will affect the cutoff frequency, but at only half the amount produced by 100%. For example, playing the C5 note on the keyboard will produce a harmonic that is an augmented fourth higher than the cutoff frequency of C4.

100% (upper position): The cutoff frequency will change at the same rate/slope as the pitch of the keyboard, centered on C4. For example, pressing the C5 key will give a cutoff frequency one octave higher than the C4 key.

EG/LFO section

AMP EG

VCA: Voltage Controlled Amplifier / EG: Envelope Generator

These are the settings for the envelope generator (EG), which controls changes in the signal volume of the VCA over time.

ATTACK knob [0...1023]

The ATTACK specifies the time required for the EG to reach its maximum level once a new note is played (note-on).

DECAY knob [0...1023]

The DECAY specifies the time required for the EG to fall to the preset sustain level once the attack portion of the EG is complete.

SUSTAIN knob [0...1023]

The SUSTAIN specifies the level that will be maintained after the decay time while the key is held down.

RELEASE knob [0...1023]

The RELEASE specifies the time required for the EG to reach its minimum level (zero) once the key or trigger is released (note off).

EG

EG: Envelope Generator

The envelope generator (EG) is used to change the pitch and cutoff frequency over time.

ATTACK knob [0...1023]

The ATTACK specifies the time required for the EG to reach its maximum level once a new note is played.

DECAY knob [0...1023]

The DECAY specifies the time required for the EG to fall to the preset sustain level once the attack portion of the EG is complete.

EG INT knob [-100%... 0%...+100%]

Adjusts the intensity of the EG.

Turning the knob to the right will increase the intensity.

When set to a negative value, the EG will be applied in the negative direction.

TARGET switch [PITCH, PITCH 2, CUTOFF]

This sets what the EG will be applied to.

PITCH: Applies the EG to the pitch of VCO 1, VCO 2 and the MULTI ENGINE.

PITCH 2: Applies the EG to the pitch of VCO 2.

CUTOFF: Applies the EG to the cutoff frequency of the FILTER.

LFO

LFO: Low Frequency Oscillator

The LFO is a low frequency oscillator that creates a repeating cyclical signal to modulate the pitch, sound and so on.

Depending on its target, the LFO can provide vibrato (PITCH); tonal changes to the Oscillators (SHAPE); or wah-wah (CUTOFF) effects.

WAVE switch [SQR □, TRI ^, SAW ∇]

The LFO can be set to a square wave (□), a triangle wave (^), or a sawtooth wave (∇).

MODE switch [1-SHOT, NORMAL, BPM]

Specifies the range of change and action for the LFO frequency.

1-SHOT: The LFO stops after a half-cycle from the time that the sound is played. The range of change for the LFO frequency will be from 0.05 Hz–28 Hz.

NORMAL: The range of change for the LFO frequency will be from 0.05 Hz–28 Hz.

BPM: This synchronizes the LFO frequency to the sequencer's BPM (beats per minute) set in each program.

RATE knob [0...1023 / 4, 2, 1, 0, 3/4...1/64]

The RATE knob adjusts the frequency of the LFO.

Turning the knob to the right will increase the LFO frequency.

INT knob [0...511]

The INT knob adjusts the intensity of the LFO.

Turning the knob to the right will increase the LFO intensity.

Tip: When turning the INT knob while holding down the SHIFT button, the LFO waveform will be inverted. The setting range is 0–511.

TARGET switch [CUTOFF, SHAPE, PITCH]

Selects the parameter where the LFO modulation will be applied.

CUTOFF: Modulation is applied according to the VCF CUTOFF knob setting.

SHAPE: Modulation is applied according to the SHAPE knob setting for the oscillator, which is set in "LFO Target OSC" (p.37) of PROGRAM EDIT mode.

PITCH: Modulation is applied according to the PITCH knob setting for the oscillator, which is set in "LFO Target OSC" (p.37) of PROGRAM EDIT mode.

EFFECTS section

The minilogue xd features high-definition digital effects. You can select one variation from each effect including delay, reverb and modulation, and combine them. Use the DEL/REV/MOD switch to select the effect type to set. Next, use the OFF/ON/SELECT switch and the TIME and DEPTH knobs to set how the effect will be applied. The effect on/off state and the values of the TIME and DEPTH knobs are saved along with each effect, so the sound that you set will remain in memory, even if you use the DEL/REV/MOD switch to switch the effect.

DEL/REV/MOD switch [DEL, REV, MOD]

Selects the effect type.

DEL: Selects the delay effect.

REV: Selects the reverb effect.

MOD: Selects the modulation effect.

OFF/ON/SELECT switch [OFF, ON, SELECT]

This sets the effect that you have selected using the DEL/REV/MOD switch.

OFF: Turns the effect off.

ON: Turns the effect on.

SELECT: When either “DEL” or “REV” is selected using the DEL/REV/MOD switch, flip the switch to SELECT to switch between the sub-types for each effect.

When “MOD” is selected using the DEL/REV/MOD switch, flip the switch to SELECT to switch between the effect types (CHORUS → ENSEMBLE → PHASER → FLANGER → USER → CHORUS → ...). When switching between sub-types, flip the switch to SELECT while holding the SHIFT button down.

Tip: USER (user effects) are not installed as factory-set default effects, so they cannot be selected, but you can load them into the minilogue xd to make them selectable. See the “logue SDK” (www.korg.com) for details.

Note: Both delay and reverb user effects cannot be used at the same time. The effect last selected will be enabled.

For details on the effect types and sub-types, refer to “Effects list” (p.59).

TIME knob

This knob specifies the delay time, reverb time or modulation time. The setting range differs depending on the effect type you select.

Turning the knob to the right will increase the speed or lengthen the time.

DEPTH knob [0.0%... 100%]

This sets the depth of the effect.

Turning the knob to the right will increase the intensity.

Tip: When either “DEL” or “REV” is selected using the DEL/REV/MOD switch, turn the DEPTH knob while holding down the SHIFT button to adjust the wet/dry balance of each effect. The setting range is MIX WET: 0% – BALANCED – MIX DRY: 0%.

Sequencer

In this section, we'll explore recording with the sequencer, one of the elements that makes up a program. This includes real-time recording, step recording and motion sequence recording, as well as how to edit the recorded sequences (step edit).

We recommend that you save the sequences you have recorded on the minilogue xd.

- ⚠ The sequence data that you record will be lost if you turn off the power or recall a different program before saving.

Step recording

1. **Press the REC button in the SEQUENCER section while the sequencer is stopped.**

"STEP REC" and "STEP 1" will be indicated in the display.

If the sequence has already been recorded, the note names will be indicated in the display.

Tip: Select the step you wish to edit. For instance, press button 3 to select step 3.

2. **Use the keyboard, REST button and other controls to edit the notes.**

When you record a note, rest, or tie in step mode, the display will automatically move to the next step.

Recording notes

The note name for the keys you press on the keyboard will be indicated in the display. Check the note name in the display, and if it is correct, release your finger to record that note and to move to the next step.

The note that you played just before releasing your fingers from the keys will be recorded. If you play a wrong note, do not release the key; instead, keep your finger on the wrong note while playing the right note. Check the note indicated in the display, and take your finger off the keyboard to move to the next step.

The "Default Gate Time" (p.41) value from SEQ EDIT mode will be used for the note length during recording. If you turn the PROGRAM/VALUE knob while playing the keyboard, the gate time for only the note(s) you played will be changed when recording. If you turn the PROGRAM/VALUE knob while playing buttons 1–16, the gate time for only the step(s) you played will be changed.

Recording a rest

You can record a rest by pressing the REST button.

Recording a tie

Press the REST button while holding down a key. The note will be tied to the next note and recorded.

3. **When the set number of steps have finished recording, step recording will automatically end.**

The number of steps is set for each program. You can change the number of steps using the "Step Length" (p.41) function in the SEQ EDIT mode. Turn the PROGRAM/VALUE knob to change the step length during step recording.

Tip: Pressing the REC button at any step during recording will stop the step recording at that step.

Real-Time recording

This feature allows you to record your keyboard performance on the minilogue xd and add overdubs (recording while adding performance data) in real time.

1. **Press the PLAY button in the SEQUENCER section while the sequencer is stopped.**

If a recording already exists, the sequence data will begin playing.

2. **Press the REC button.**

Real-time recording will begin, and the REC button will light.

3. **Play the keyboard.**

The note(s) you play will be recorded.

4. **Press the REC button once more to stop the recording.**

The REC button will go dark.

Press the REC button once more to start recording again.

Tip: When you hold down the REST button during real-time recording, the existing notes in the sequence will be deleted.

5. **Press the PLAY button to finish real-time recording.**

The PLAY button will go dark.

Recording a motion sequence

Motion sequencing allows you to record the flipping of switches and the turning of knobs as part of the sequence, and recreate those motions automatically during playback.

Up to four motion sequences can be recorded, which includes changes to the knobs and switches.

Note: The knobs, switches for which you cannot record motions are as follows.

MASTER knob, TEMPO knob, OCTAVE switch (MASTER), MULTI ENGINE TYPE-USR, DRIVE switch (FILTER), DEL/REV/MOD switch, SELECT setting of the OFF/ON/SELECT switch.

1. **Press the PLAY button to play the sequencer, and then press the MOTION MODE button.**
"MOTION VIEW" will appear in the display, and the motion sequence saved to the program will show up as a visual graphic.

2. **Press the REC button.**
Real-time recording will begin.
3. **Move the knobs and switches on the minilogue xd.**
You can record up to four motion sequences for the knobs and switches.
Note: If you exceed this limit, the message "Motion Full" will be shown in the display, and the display will enter MOTION CLEAR in the SEQ EDIT mode. See steps 2 and afterwards in "Deleting a motion sequence" (p.30) for details.
Note: For motion sequences of knobs and switches you moved that are already recorded, the data previously recorded will be overwritten.
4. **After the set number of steps have finished recording, the Motion Sequence will automatically finish recording as well.**
Follow steps 2 and on to record motion sequences for other knobs and switches. The number of steps is set for each program. You can change the number of steps using the "Step Length" (p.41) function in the SEQ EDIT mode.

Deleting a motion sequence

You can delete one of the previously recorded motion sequences from “MOTION CLEAR (1...4)” (p.42) in SEQ EDIT mode.

Tip: To delete all motion sequences at once, use “Motion Clear” (p.41) in SEQ CLEAR, SEQ EDIT mode.

1. Press the EDIT MODE button a number of times to select SEQ EDIT mode.

2. Press button 10 to enter MOTION CLEAR.

Tip: While the SHIFT button is pressed, the MOTION VIEW screen will be displayed, where you can see the graphics for the motion sequences you have recorded.

3. Press button 10 a number of times to select the motion sequence to delete.
4. Turn the PROGRAM/VALUE knob to select “CLEAR...?”, and press the WRITE button.
The selected motion sequence will be deleted.
5. Press the EXIT button.

Editing sequence data (step edit)

Using Step Edit, you can edit the notes and motion sequences that you previously recorded into sequence data.

1. Select a program that includes the sequence data you wish to edit.

The MOTION MODE button and buttons 1–16 will light and go dark to show the status for each step.

Buttons 1–16	Button goes dark	Button lights
MOTION MODE button		
Button goes dark	Disabled, or no note data available	Enabled (note data is recorded)
Button lights	Disabled, or no motion sequence data	Enabled (motion sequence data is recorded)

2. Edit the notes and motion sequences for the steps, using the MOTION MODE button and buttons 1–16.

Play the note.

Doing so will make the MOTION MODE button go dark.

- Hold down one of buttons 1–16 and play a note on the keyboard to record a note at that step.
- Holding down multiple buttons 1–16 and playing a note on the keyboard will record the same note at all of the selected steps.
- Holding down multiple buttons 1–16 next to each other and playing a note on the keyboard will connect the notes inputted in these steps with a tie.
- If you turn the PROGRAM/VALUE knob while playing buttons 1–16, the gate time for only the step(s) you played will be changed. See “Default Gate Time” (p.41) for details on setting the gate time.

Input a motion sequence.

Doing so will make the MOTION MODE button light up.

Tip: When the MOTION MODE button is lit, the recorded motion sequence will show up as graphics in the display.

- Hold down one of buttons 1–16 and move a knob or switch to record a motion sequence at that step.
- Holding down multiple buttons 1–16 and moving a knob will record the motion sequence at all of the selected steps.

For example, if you hold down buttons 3 and 5 and turn the LFO INT knob to “50%,” the LFO INT 50% value will be recorded for steps 3 and 5 respectively. When recording a motion sequence in real time, you can only record continuous changes in value. However, if you use the step recording feature to record changes as a motion sequence, the changes recorded as a motion sequence will be recorded per step.

Enable or disable the steps.

- Press buttons 1–16 to enable (the button will light) or disable (the button will go dark) the steps.

Note: If a note or motion sequence is not recorded for a step, you cannot enable that step.

Set the active step.

Using the “Shift Function” in GLOBAL EDIT mode, begin by selecting “Active Step” (the “Favorite” is already configured by factory default). Refer to “Shift Function” (p.47) for details. Pressing buttons 1–16 will turn the motion for the corresponding steps on (the button will light) or off (the button will go dark). If motion has not been recorded for a step, it cannot be turned on.

3. **After you finish step editing, press the PLAY button to check your sequence data.**
The PLAY button will light.

Other editing functions

Use the SEQ EDIT mode when setting the step length, step resolution and other parameters during sequence step recording, as well as for deleting sequence data, or for editing or deleting motions. See “SEQ EDIT mode” (p.40) for details.

Edit mode

Although nearly all of the minilogue xd's main parameters can be edited using the knobs and switches on the panel, the other detailed parameters are accessed using the **Edit mode**. There are three sub-modes within the Edit mode: **PROGRAM EDIT mode**, **SEQ EDIT mode**, and **GLOBAL EDIT mode**.

How to enter the Edit mode

1. Press the EDIT MODE button.

Each Edit mode is shown in the display, and the buttons light.

2. Press the EDIT MODE button a number of times or use the PROGRAM/VALUE knob to select PROGRAM EDIT mode, SEQ EDIT mode, or GLOBAL EDIT mode.

PROGRAM EDIT mode: This mode is used for program editing functions, such as to change the program name and assign a parameter to the joystick or CV INPUT jack, as well as to select a microtuning and so on.

SEQ EDIT mode: This mode is used to set the BPM and configure other step sequencer settings, as well as to delete sequence data and so on.

GLOBAL EDIT mode: Use this mode to set how the knobs and switches should function, as well as settings such as MIDI for the entire synthesizer.

3. Press one of the lit buttons from 1 to 16.

The minilogue xd will enter the selected edit mode, and the parameter names will be indicated in the display.

- You can go to the page at right by pressing the same button.
Press the same button while holding the SHIFT button down to show the page to the left.
- Turn the PROGRAM/VALUE knob to set the parameters.
For more on the parameters, see "PROGRAM EDIT mode" (p.35), "SEQ EDIT mode" (p.40) and "GLOBAL EDIT mode" (p.43).

4. Press the WRITE button to save your parameters after you have configured the parameters in PROGRAM EDIT mode and SEQ EDIT mode.

Tip: Settings in GLOBAL EDIT are saved automatically when going to a different page.

⚠ If you select another program after you have configured the parameters in the PROGRAM EDIT mode and the SEQ EDIT mode without saving your changes, your settings will be lost.

Button 5 (CV INPUT)

Two CV IN jacks are available on the minilogue xd. These jacks let you control the internal parameters via CV (control voltage) input, by connecting a modular synthesizer or other device to the minilogue xd. CV/Gate signals are also supported.

CV IN Mode [Modulation, CV/Gate]

Sets the input mode for the CV IN 1, 2 jacks.

The input voltage range in modulation mode is from -5V to 5V.

CV/Gate: CV1 IN1 is the input jack for pitch CV signals, and CV2 IN2 is the input jack for gate signals. Standard CV (control voltage) and gate signals will play the notes on the minilogue xd. The CV input voltage range in CV/Gate mode is from -3V to 5V. Inputting a 1V signal will generate a C4 note. The minilogue xd is compatible with standard volt/oct signals. The ideal gate signal is a 0-5V pulse.

CV IN1 Assign [GATE TIME...REVERB DEPTH]

This sets the parameters that are controlled by the CV inputted to the CV IN1 jack.

The parameters that can be assigned are the same as those for Y+ Assign. See “Y+ Assign” (p.35) for details.

Equal Temp: Spacing all semitones at equal pitch intervals, this temperament is the most widely used.

Pure Major: Major chords in the primary key selected will be perfectly in tune.

Pure Minor: Minor chords in the primary key selected will be perfectly in tune.

Pythagorean: This ancient Greek scale is especially effective for playing melodies. It consists of perfect fifths; however, other intervals—the major third in particular—will sound out of tune.

Werckmeister: The Werckmeister III scale was used in the later Baroque period, providing equal temperament tuning.

Kirnberger: The Kirnberger III scale is used mainly for tuning harpsichords.

Slendro: This is an Indonesian gamelan scale with five notes per octave.

Pelog: This is an Indonesian gamelan scale with seven notes per octave.

Ionian: This is a major scale with seven notes per octave.

Dorian: This is a scale with seven notes per octave, with the sixth note of the Ionian scale raised a semitone.

Aeolian: This is a natural minor scale with seven notes per octave.

Major Penta: This is a major pentatonic scale.

Minor Penta: This is a minor pentatonic scale.

Reverse: This is a scale that symmetrically inverts the notes on the keyboard, with C4 as the center.

AFX 001...006: These are an original scale created by Aphex Twin, set for the entire note range.

DC 001...003: These are an original scale created by Dorian Concept, set for the entire note range.

USER SCALE 1...6: These are a user-defined scale based on equal temperament tuning, which lets you alter the pitches of each note over the entire keyboard range in semitones and cents. Refer to "Microtuning" (p.50) for how to set this.

USER OCTAVE 1...6: These are a user-defined scale based on equal temperament tuning, which lets you alter the pitches of each note in semitones and cents over one octave (C through B). Refer to "Microtuning" (p.50) for how to set this.

Scale Key **[-12 Note...0 Note...+12 Note]**

Sets the scale key used in microtunings.

The preset tuning is the key of C. Adjust the "Scale Key" setting if you want to use a different key. For example, set the scale key to "+2 Note" if you want to use the key of D.

Note: This setting will have no effect if microtuning is set to "Equal Temp" (equal temperament tuning).

Program Tuning **[-50 Cent...0 Cent...+50 Cent]**

This adjusts the tuning of the program in one-cent units (1 semitone=100 cents), over a range of ± 50 cents.

Use the LFO Voice Sync to choose whether the phase of the LFO will be synchronized between voices.

Button 8 (MODULATION)

EG Velocity [0..127]

Sets the strength of the Cutoff EG Int using velocity. EG Velocity is used to specify how much the EG Int will change according to the keyboard velocity.

If EG Int is set to any other value besides "0", the keyboard velocity can be used to soften the EG Int.

Amp Velocity [0..127]

Amp Velocity is used to specify how much the volume will change according to the keyboard velocity.

0: The velocity will have no effect.

The larger the value, the more effect that keyboard velocity will have.

MIDI Aftertouch [BALANCE...GATE TIME]

Sets the parameters to assign to MIDI aftertouch messages from external MIDI devices.

The parameters that can be assigned are the same as those for Y+ Assign. See "Y+ Assign" (p.35) for details.

Button 9 (OTHER SETTINGS)

Multi Octave [16', 8', 4', 2']

You can set the transposition of the MULTI ENGINE in octaves.

Multi Routing [Pre VCF, Post VCF]

This sets whether the MULTI ENGINE is mixed prior to the signal reaching the VCF, or whether to bypass the VCF and mix.

Note: When this is set to "Post VCF," the VCF will not affect the MULTI ENGINE.

EG Legato [Off, On]

On: The length of portamento that is set using the PORTAMENTO knob will be synchronized with the BPM (beats per minute).

Program Level [-18.0dB...0.0 dB...+6.0dB]

Sets the program volume.

This allows you to adjust the volume of a program relative to other programs.

Increasing this value will make the volume louder.

Button 10 (MULTI ENGINE)

This button configures the MULTI ENGINE settings.

The parameters that are displayed will change, depending on the settings in “NOISE/VPM/USR switch” (p.19), MULTI ENGINE.

When the noise generator is selected

There are no parameters to set for the noise generator.

When the VPM oscillator is selected

The VPM oscillator has 16 types, each with six parameters.

You can set these parameters to make changes to the sound.

If all parameters are set to “0%”, the effects set in the types will be used, and the effect will increase as the value is increased (+).

Press the WRITE button to initialize the program. The display will indicate the message "Initialized".

Button 14 (DUMP)

Program Dump

Transmits the SysEx data for the currently selected program to another minilogue xd, MIDI data filer, computer or other compatible device that is connected to this instrument.

Turn the PROGRAM/VALUE knob until "Press WRITE" is indicated in the display.

Press the WRITE button to send a SysEx program dump from the minilogue xd's MIDI OUT and USB B port. The message "Transmitting" will be shown in the display during data transmission.

SEQ EDIT mode

64th: A single step will be set to the length of a sixty-fourth note.

48th: A single step will be set to the length of a thirty-second note triplet.

24th: A single step will be set to the length of a sixteenth note triplet.

16th: A single step will be set to the length of a sixteenth note.

16.th: A single step will be set to the length of a dotted sixteenth note.

12th: A single step will be set to the length of an eighth note triplet.

8th: A single step will be set to the length of an eighth note.

Gate Time [0%...100%]

Sets the arpeggiator gate time to a value from 0 to 100%.

Button 7 (SEQ PARAMETER)

This group provides control of various sequencer timing and resolution parameters such as Gate Time, Swing, etc.

Step Length [1...16]

Step Length allows you to set the number of steps used by the Step Sequencer. Turn the PROGRAM/VALUE knob to change the number of steps during step recording.

Step Resolution [1/16, 1/8, 1/4, 1/2, 1/1]

The step resolution is used to set the length of each step in the step sequencer.

1/16: A single step will be set to the length of a sixteenth note.

1/1: A single step will be set to the length of one measure. Use this when you want to play long chords.

Swing [-75%...0%...+75%]

The Swing parameter adjusts the intensity of the swing. When the voice mode is "ARP", the value set here is also used for the arpeggiator swing.

Default Gate Time [0%...100%]

The Gate Time is the default value used for each step recorded using the step sequencer. Lower values are more staccato, higher values have a longer gate time. When the voice mode is "ARP", the value set here is also used for the arpeggiator gate time.

Button 8 (SEQ CLEAR)

This function provides a convenient way to delete all data within a specific sequence.

All Clear

When using All Clear, all notes and motion sequences contained within the sequence data will be deleted.

Turn the PROGRAM/VALUE knob until "Press WRITE" is indicated in the display. Press the WRITE button to delete. The display will then indicate the message "Cleared".

Motion Clear

With Motion Clear, only the motion sequences contained within the sequence data will be deleted.

Turn the PROGRAM/VALUE knob until "Press WRITE" is indicated in the display. Press the WRITE button to delete all of the motion sequence data. The display will then indicate the message "Cleared".

Button 10 (MOTION CLEAR)

MOTION CLEAR (1...4)

You can delete motion sequences one at a time here. See “Deleting a motion sequence” (p.30) for details.

Tip: While the SHIFT button is pressed, the MOTION VIEW screen will be displayed, where you can see the graphics for the motion sequences you have recorded.

Button 11 (MOTION ENABLE)

MOTION ENABLE (1...4) [OFF, ON]

Use this to enable or disable motion 1–4.

OFF: The motion sequence will be disabled, and the parameters will not change (the recorded motion sequence will not be deleted).

Press button 11 to select the motion sequence to configure, and turn the PROGRAM/VALUE knob to select either “OFF” or “ON”.

Tip: While the SHIFT button is pressed, the MOTION VIEW screen will be displayed, where you can see the graphics for the motion sequences you have recorded.

Button 12 (MOTION SMOOTH)

The motion of a motion sequence (Motion 1–4) can step from one value to the next, or it can transition smoothly from one value to the next by applying MOTION SMOOTH.

OFF: The motion sequence will make changes to the sound in steps.

ON: The motion sequence will change smoothly, and make smooth changes to the sound.

Press button 12 to select the motion sequence to configure, and turn the PROGRAM/VALUE knob to select either “OFF” or “ON”.

Tip: While the SHIFT button is pressed, the MOTION VIEW screen will be displayed, where you can see the graphics for the motion sequences you have recorded.

GLOBAL EDIT mode

Button 3 (GLOBAL 1)

This button sets the parameters related to the overall pitch (how high or low the sound is). These functions control the tuning and transposition of the minilogue xd.

Master Tune [-50 Cent...0 Cent...+50 Cent]

This adjusts the overall tuning of the entire minilogue xd in one-cent units (semitone = 100 cents), over a range of ± 50 cents.

0: A4 is equal to 440 Hz.

Transpose [-12 Note...0 Note...+12 Note]

Sets the pitch in semitones. The range you can set is within one octave, up and down.

Button 4 (GLOBAL 2)

Metronome [Off, On]

Sets whether the metronome will sound during real-time recording.

D. Pedal Polarity [- (KORG), +]

Sets polarity to the same polarity as the damper pedal that is connected to the DAMPER jack. If the polarities do not match, the damper pedal will not operate correctly.

- (KORG): Use this setting when connecting an optional DS-1H damper pedal (sold separately) or a PS-3/PS-1 pedal switch (sold separately). The polarity of Korg damper pedals and pedal switches is “-” (↓ : open type).

+: Use this setting when connecting damper pedals with a “+” polarity (↑ : closed type). If the polarities do not match, the damper pedal will not operate correctly.

Local SW [Off, On]

Sets the local control.

Normally, this is “On.” However, if you are using the minilogue xd with an external sequencer or sequencing software, you will want to set the local connection to “Off” to eliminate the double-triggering of notes caused by MIDI echo.

Off: Disconnects the keyboard (**xd-m**) buttons 1–16) from the tone generator.

Velocity Curve [Type 1...8, Const 127]

xd This selects how the minilogue xd changes the volume and sound, in response to velocity (how hard you strike the keys).

Type 1	This curve requires you to play strongly in order to produce an effect.
Type 2, 3	:
Type 4	This is a typical curve.
Type 5	:
Type 6	This curve produces an effect without requiring you to play very strongly.
Type 7	This curve produces a fairly steady effect with little change for medium-strength playing.
Type 8	This curve produces a fairly steady effect with little change for medium-strength playing (a flatter curve than 7).
Const 127	All notes will sound at maximum velocity.

Curve types 7 and 8 produce little change for medium-strength playing, and are suitable when keyboard velocity is not required, or when you want to play each note at the same velocity. However, these curves will produce a great deal of change with softly played notes, so the sound may be more difficult to control. Choose the curve that is most appropriate for your playing dynamics or for the effect you want to obtain.

Knob Mode **[Jump, Catch, Scale]**

The front panel knobs can operate in one of three modes:

Jump: When you turn the knob, the parameter value will jump to the value indicated by the knob. Since this makes it easy to hear the results while editing, we recommend that you use this setting.

Catch: Turning the knob will not change the parameter value until the knob position matches the stored value. We recommend that you use this setting when you don't want the sound to change abruptly, such as while performing.

Scale: When you turn the knob, the parameter value will increase or decrease in a relative manner in the direction that it is turned. When you turn the knob and it reaches the full extent of its motion, it will operate proportionate to the maximum or minimum value of the parameter. Once the knob position matches the parameter value, the knob position and parameter value will subsequently be linked.

If the parameter value does not change

In some cases, the parameter value may not change, even when you turn the knob from left to right. This means that the knob mode is set to "Catch".

In this case, the actual value of the parameter you're editing (the value shown in the display) will not change unless it matches the position of the knob. In Catch mode, the knob position and the value will be linked only when the knob position reaches the actual value. This prevents an unnatural change in sound that is caused when a value suddenly changes.

Let's say that you've turned the knob to edit a certain parameter, and that the knob is in the position shown.

The actual value of the parameter is at the position shown by the triangle. The parameter value will not change until the knob position reaches the triangle mark.

Once the knob has reached the position corresponding to the actual value, the parameter value and the knob position will be linked, and the value will change as you turn the knob.

Button 5 (GLOBAL 3)

These parameters relate to the SYNC IN and OUT jacks settings.

Sync In Unit [16th Note, 8th Note]

This sets how much the sequencer will advance with each pulse received via the SYNC IN jack.

16th Note: The sequencer will advance one sixteenth note for each pulse.

8th Note: The sequencer will advance one eighth note for each pulse.

Sync Out Unit [16th Note, 8th Note]

This sets when to send each pulse via the SYNC OUT jack, according to how far the sequencer has advanced.

16th Note: A pulse will be outputted for every sixteenth note.

8th Note: A pulse will be outputted for every eighth note.

Sync In Polarity [Rise, Fall]

In order to achieve synchronization with other units, the polarity of the SYNC IN jack may need to be changed.

Rise: The minilogue xd will create a sync pulse as it rises to its crest (the highest point) of the waveform.

Fall: The minilogue xd will create a sync pulse as it falls to its trough (the lowest point) of the waveform.

Sync Out Polarity [Rise, Fall]

In order for other units to correctly sync with the minilogue xd, the polarity of the SYNC OUT jack may need to be changed.

Rise: The minilogue xd will create a sync pulse as it rises to its crest (the highest point) of the waveform.

Fall: The minilogue xd will create a sync pulse as it falls to its trough (the lowest point) of the waveform.

Button 6 (GLOBAL 4)

These parameters relate to the minilogue xd's MIDI capabilities.

MIDI Route [USB+MIDI, USB]

MIDI signals can be sent and received via the MIDI connector and USB port, or by the USB port alone.

USB+MIDI: MIDI messages are received via the USB B port and the MIDI IN connector; messages are transmitted from the USB B port and the MIDI OUT connector.

USB: MIDI messages will be transmitted and received only via the USB B port. When using the USB port as a MIDI interface, it is advantageous to use this setting.

MIDI Ch [1...16]

Specifies the MIDI channel of the minilogue xd.

This MIDI channel is used to transmit and receive note messages, as well as control change messages like pitch bend and data dump messages.

Clock Source **[Auto (USB), Auto (MIDI), Internal]**

Many features of the minilogue xd can be synchronized to the tempo or BPM. This parameter specifies whether the clock source is internal, or an external MIDI clock source.

Auto (USB), Auto (MIDI): When there is no input, the internal clock will be used. When input is detected, the internal clock will be synchronized to external MIDI clocks from the USB B and MIDI IN connectors respectively.

Internal: Only the internal clock will be used.

- 🔊 When a cable is plugged into the SYNC IN jack, the internal clock is synchronized to the SYNC IN jack clock, regardless of the MIDI clock settings.

En Rx Transport **[Off, On]**

Sets whether transport-related messages received as part of MIDI real-time messages such as start, stop and continue will be received.

Poly Chain **[Off, Master, Slave]**

Sets the poly-chain function.

Off: Use the “Off” setting when you will not be connecting devices in poly-chain.

Master: Sets this as the master side device when connecting in poly-chain.

Slave: Sets this as the slave side device when connecting in poly-chain.

Note: You cannot operate devices that are set to “Slave,” besides configuring the global settings and using the MASTER knob, tone parameters are determined by the “Master” unit.

Button 7 (GLOBAL 5)

MIDI Rx Prog Chg **[Off, On]**

Selects whether MIDI program change messages will be received.

MIDI Rx CC **[Off, On]**

Selects whether MIDI control change messages will be received.

Tip: CC#1 (Modulation Wheel), CC#64 (Damper) and CC#120 onward cannot be controlled using this setting.

MIDI Rx Pitch Bend **[Off, On]**

Selects whether MIDI pitch bend messages will be received.

MIDI Tx Prog Chg **[Off, On]**

Selects whether MIDI program change messages will be transmitted.

MIDI Tx CC **[Off, On]**

Selects whether MIDI control change messages will be transmitted.

MIDI Tx Pitch Bend **[Off, On]**

Selects whether MIDI pitch bend messages will be transmitted.

Button 8 (GLOBAL 6)

These parameters relate to the minilogue xd's display and power settings.

Parameter Disp [Normal, All]

Normal: Only major information such as operating the pitch-related knobs or switching the effect types will be displayed.

All: When any knob except for the MASTER knob and the MULTI ENGINE TYPE knob are turned, the value is shown; and when operating a switch, the setting is shown. Parameters for switches that have an LED may not show up in the display. When the value of the knob or switch is nearly the same as the original, an asterisk ("*") will be displayed to the right of the value. When the value of the knob or switch is close to the original or when it crosses over the original value, either "→" or "←" will be displayed.

This will be displayed when operating the knob or switch, and will not be displayed while in Edit mode.

Brightness [1...10]

Adjusts the display brightness.

- ⚠ Continuous use of the minilogue xd while the brightness is set to a high value will have an adverse effect on the overall life of the display.

Auto Power Off [Off, On]

Sets whether the **auto power off feature** is enabled.

Off: The auto power off feature will be disabled.

On: The auto power off feature is enabled. When the minilogue xd is not played or operated for four hours, the power will automatically shut down. See "Auto power off feature" (p.9) for details.

Oscilloscope [Disable, Enable]

In place of the Program name and number, the oscilloscope feature can be used to show a waveform tracing of the sound.

Disable: The display will indicate the Program name and number.

Enable: The sound will be displayed as an electrical signal (waveform).

Shift Function [Favorite, Active Step]

This sets the function that will be used in Play mode when pressing a step button while holding down SHIFT.

Favorite: The Favorite function will be used.

Other functions

Tuning

As with all analog instruments, the minilogue xd's circuitry can drift over time during performance due to changes in environment and temperature. The minilogue xd provides an **auto-tuning function** that automatically tunes the instrument's analog circuits on demand, to correct for any analog drift. Auto-tuning will be done when the minilogue xd is not producing a sound. As you continue to play the minilogue xd for a while right after you've turned it on, the pitch and tone may gradually drift. If the pitch drift becomes noticeable, use the steps below to tune the minilogue xd. This will manually bring the instrument back into tune.

Note: The internal temperature tends to change more right after the power is turned on, which may cause the instrument to go out of tune.

1. Press the REC button while holding down the SHIFT button.

Tuning will begin, and "Tuning..." will be shown in the display. The tuning will take about 15 seconds.

Tip: Press the REC button while holding down the SHIFT button again to cancel manual tuning, if you accidentally started it by mistake.

Note: During tuning, you will temporarily be unable to play the minilogue xd.

Microtuning

Microtuning is a feature that changes the pitch of the notes you play on the keyboard (which are normally tuned in equal temperament) to a different tuning.

The minilogue xd features preset microtunings, and lets you create your own microtunings.

Twelve microtunings are available to edit. Out of these, you can adjust the pitch on all of the notes on the keyboard for six microtunings called "user scales." The other six microtunings are called "user octaves," which let you change the tuning of each note within one octave, and that octave's tuning will be repeated across the keyboard.

The minilogue xd lets you select a different microtuning for each program. See "Microtuning" (p.36), PROGRAM EDIT mode for details.

Editing the microtunings

Here, we will edit USER SCALE 3.

1. Press the EDIT MODE button to enter GLOBAL EDIT mode.

2. Press button 10 three times.

"USER SCALE 3" will be indicated in the display.

3. Play the note on the keyboard that you want to edit.

The note name will be indicated in the display.

While this screen is displayed, the minilogue xd will play use the microtuning you are currently editing.

Tip: You can play up to four notes at the same time to edit their tunings together.

4. Turn the PROGRAM/VALUE knob to set how many cents you want to detune the note compared to equal temperament tuning.

You can also turn the PROGRAM/VALUE knob while holding down the SHIFT button to have the note you are playing sound a different note.

When editing the **USER OCTAVE**, use step 2 above to display the USER OCTAVE screen by pressing button 11, and proceed from step 3.

Poly-chain

You can use this function to poly-chain this instrument to another minilogue xd, letting you play them together as an eight-voice synthesizer.

First of all, set the device on the master side to "Master," and the device on the slave side to "Slave."

Next, connect the MIDI OUT connector of the master side to the MIDI IN connector of the slave side using a MIDI cable.

Audio signals will be outputted through each device respectively. Use an external mixer or other device to adjust the signal volumes from the OUTPUT jacks of both instruments.

When playing the master side device, voices 5–8 will sound on the slave side, and you can play a total of eight voices. Refer to "Poly Chain" (p.46) for details.

Restoring the factory settings

You can restore the minilogue xd's preset programs and global settings to their original factory-set state at any time.

1. **Begin with the minilogue xd turned Off.**
2. **While holding down the WRITE button and the EXIT button, turn the minilogue xd On.**
"FACTORY RESET" will be indicated in the display.
3. **Turn the PROGRAM/VALUE knob to select the items you wish to reset to the factory default settings.**
PRESET: Restores the preset programs (001–200) and the live set to their factory-set default settings.
 If you do not want to erase the preset programs, press the WRITE button to save them to the user programs (201–500).
GLOBAL: Restores the GLOBAL settings to their factory-set default settings.
ALL: Restores the preset programs, user programs, the live set and GLOBAL settings to their factory-set default settings.
 Use caution, as this will replace all data with the factory-set default settings (including the sounds saved to the user programs).
4. **Press the WRITE button.**
The display will indicate the message "Are you sure?".
5. **Turn the PROGRAM/VALUE knob to select "Yes", and press the WRITE button.**
The factory-set default data will be reloaded, and the minilogue xd will be restored to its factory default state.
 Never turn off the minilogue xd while data is being loaded. Doing so might damage the internal data.

Using with other devices

Making connections with the SYNC IN/OUT jacks

The minilogue xd can be connected to other instruments such as the Korg volca series or DAW equipment that have a SYNC IN and OUT jack, allowing multiple devices to play back together in sync.

When controlling an external device from the minilogue xd

To synchronize the minilogue xd to other devices such as the volca, use a stereo mini cable to connect the SYNC OUT jack of this instrument to the SYNC IN jack of the external device.

Use the same settings for “Sync Out Unit” (p.45) on this minilogue xd and “Sync In Unit” on the first external device to sync. Similarly, use the same settings for “Sync In Unit” on the second external device to sync.

See the owner’s manuals of each respective external device to synchronize.

Starting the sequencer on the minilogue xd will make the sequencer of the connected device synchronize with the minilogue xd.

Controlling the minilogue xd from an external device

In order to synchronize this instrument to external devices, use a stereo mini cable to connect the SYNC OUT jack of the external device to the SYNC IN jack of the minilogue xd.

Use the same settings for “Sync In Unit” (p.45) on this minilogue xd and “Sync Out Unit” on the external device. Similarly, use the same settings for both the “Sync In Polarity” (p.45) and the “Sync Out Polarity” on the external device.

See the owner’s manuals of each respective external device to synchronize.

Starting the sequencer on the external device will make the sequencer of the minilogue xd synchronize with that device.

Making connections with the CV IN jacks

Connect these jacks to a external device that can output CV signals to control the minilogue xd. Connect the CV IN jack of the minilogue xd to the CV OUT jack of the external device using a monaural mini cable (or a stereo mini cable).

Configure the CV IN jack settings on the minilogue xd from “Button 5 (CV INPUT)” (p.36). See the owner’s manuals of each respective external device to synchronize.

Connecting to a MIDI device or a computer

MIDI stands for Musical Instrument Digital Interface, and is a worldwide standard for exchanging various types of musical data between electronic musical instruments and computers.

When MIDI cables are used to connect two or more MIDI devices, performance data can be exchanged between the devices, even if they were made by different manufacturers.

MIDI data can also be exchanged between the minilogue xd and your personal computer using a single USB cable. MIDI control change numbers (CC#) are assigned to the main parameters used for altering the sound. You can use an external MIDI sequencer or the like to trigger the sound engine while controlling these parameters. You can also use the front panel knobs or buttons to transmit these control change messages, in order to control an external MIDI device.

You can also synchronize the minilogue xd’s tempo to the MIDI clock of an external MIDI sequencer or other device, so that the minilogue xd will play in time with the external device and with any changes you make.

Controlling an external MIDI tone generator from the minilogue xd

If you want to use the minilogue xd’s keyboard, controllers, and sequencer to play sounds on or control an external MIDI tone generator, connect the minilogue xd’s MIDI OUT connector to the external MIDI tone generator’s MIDI IN connector using a MIDI cable.

Controlling the minilogue xd from an external MIDI device

If you want to play or control the minilogue xd from another MIDI keyboard, sequencer, or other device, connect the MIDI OUT connector of the external MIDI device to the minilogue xd's MIDI IN connector with a MIDI cable.

Connecting the minilogue xd to an external MIDI sequencer or computer

You can also play the minilogue xd's keyboard and record your performance on an external MIDI sequencer or computer (connected using the MIDI interface), and then play the minilogue xd while monitoring or playing back what you recorded. Also, you might want to use the minilogue xd as both an input device for playing notes and as a MIDI tone generator. In either case, you'll need to connect the MIDI OUT connector to the MIDI IN connector on both the minilogue xd and the external MIDI sequencer or computer.

⚠ Some MIDI interface devices may be unable to transmit or receive MIDI SysEx messages to or from the minilogue xd.

Tip: It's convenient to use the USB port when connecting the minilogue xd to a computer.

Connecting the minilogue xd to a computer via USB

In order to use a USB connection, you'll need to install the Korg USB-MIDI driver on your computer. Download the "Korg USB-MIDI driver" from the Korg website, and install it as described in the accompanying documentation.

⚠ If either the MIDI connection or the USB connection is not working properly, check the settings in "MIDI Route" (p.45).

MIDI-related settings (after making connections)

Setting the MIDI channel

In order to exchange data with a connected external MIDI device, you must set the minilogue xd's MIDI channel to match the MIDI channel of the external MIDI device.

Refer to "MIDI Ch" (p.45) to set the minilogue xd's MIDI channel.

Tip: When synchronizing to an external MIDI device, refer to that device's owner's manual.

Configuring the MIDI "LOCAL" setting when connected to an external MIDI sequencer or computer

The Echo Back setting of your external MIDI sequencer or computer system allows the MIDI notes and other messages being played by the minilogue xd to be instantly passed along to any other MIDI equipment, including synthesizers, tone generators. However, this same Echo Back function can cause the minilogue xd to double trigger: once when you play the note, and a second time as the external MIDI sequencer or computer system sends the note back to the minilogue xd. To prevent this from happening, you can simply turn off the "Local SW" (p.43) in GLOBAL EDIT mode on the minilogue xd.

MIDI filter settings

Use these settings to configure whether program changes, control changes and pitch bend messages will be transmitted and received.

Use "Button 7 (GLOBAL 5)" (p.46) to make these detailed settings.

Synchronizing your performance with the sequencer

Use "Clock Source" (p.46) to set whether the minilogue xd will be the master (the device controlling the synchronization) or the slave (the device being controlled) when the sequencer is playing.

When synchronizing to an external MIDI device, refer to that device's owner's manual.

Using the minilogue xd as the master to slave external MIDI devices

Connect the MIDI OUT connector of the minilogue xd to the MIDI IN connector of your external MIDI device(s).

Set the "Clock Source" (p.46) on the minilogue xd to "Internal". Configure the external MIDI device to receive clock data via MIDI. The minilogue xd will act as the master, and the tempo that is set using the TEMPO knob on the minilogue xd will be sent as MIDI timing clock data to operate the external MIDI device (sequencers, rhythm machines, and so on).

Slaving the minilogue xd clock to an external MIDI device (master)

Connect the MIDI IN connector of the minilogue xd to the MIDI OUT connector of your external MIDI device.

Set the "Clock Source" (p.46) of the minilogue xd to "Auto (MIDI)," and configure the external MIDI device to transmit MIDI clock data.

The minilogue xd will automatically act as the slave whenever a MIDI timing clock is received, and will be driven by the tempo of the external MIDI device (sequencers, rhythm machines, and so on).

Note: Even if you set the "Clock Source" on the minilogue xd to "Auto (USB)" or "Auto (MIDI)," the minilogue xd will operate in internal MIDI clock mode, unless a clock is received from an external device.
